Name

rmlsend — Send Rivendell Macro Language (RML) commands

Synopsis

rmlsend [**--from-file=**_filename_] [**--to-host=**_hostname_] [**--to-port=**_port_] [_rml_]

Description

rmlsend(1) is a small utility that can be used to send RML commands to a local or remote Rivendell host. It can operate in two modes: GUI or a command line interface (CLI).

If started with no arguments, **rmlsend**(1) will come up in GUI mode, otherwise it will attempt to perform the specified operation and then exit.

Options

--from-file=_filename_   Take the command(s) to send from _filename_, rather than specifying them on the command-line. If **-** is specified as _filename_, the commands will be read from standard input.

--to-host=_host_   Send the specified command(s) to _host_.

--set-port=_port_   Send the specified command(s) to UDP port _port_. Default value is **5858**.
