
Name

rdadmin — Module for configuring the Rivendell Radio Automation System

Synopsis

```
rdadmin [--add-host-entry]
```

Description

The **rdadmin**(1) module is used to manage the configuration of the Rivendell Radio Automation System. When started with no arguments, it will prompt for the credentials of a Rivendell user that has the **Administer System** or **Administer RSS Feeds** permissions. If authentication of those credentials is successful, it will then display the main **rdadmin**(1) button menu.

If invoked by a system user with an effective user id of 0 --i.e. "root" -- and the **--add-host-entry** option is specified, **rdadmin**(1) will bypass the login process and prompt the user to create a new host entry for the local system, following which it will exit.

For documentation of the GUI elements of **rdadmin**(1), see the **Rivendell Administration** section of the **Rivendell Operations Guide**.
